

Pet Waste can contain:

- E.coli
- Salmonella
- Giardia
- Roundworms and Hookworms
- Nitrogen, which with excessive amounts depletes the oxygen for other organisms by causing algae blooms.

All of the bacteria in pet waste can cause serious health problems in humans. If these pathogens enter the watershed, the water will be dangerous for recreational activities.

Thank you for reading
and disposing of your
pet's waste properly!

Pet Waste

Picking up our dog's waste and throwing it out is a small change that can make a big difference in keeping our waters clean.

Milton Public Works

Stormwater Information

Anytime pet waste is left in your yard, on the side of the road, or on the trails in Town, rain washes it into the stormwater drainage system.

The waste, and its contaminants, make its way to streams, rivers, and then to our lakes.

How to Dispose of your Pet's Waste Properly:

Please, always carry a plastic or paper bag while you are out with your furry friend. Clean up their waste using the bag, and dispose of it in the garbage.

Please do not recycle pet waste. It contaminates the rest of the Recycling, which will then need to be discarded as garbage.

Please do not litter by throwing your bags into the woods.

Help our watershed stay free of contaminants, do your duty and clean up after your pet!

When a waterbody, has impairments such as E.coli, the water cannot be used for all of the recreational activities the residents of Milton enjoy.

YOUR STORM DRAIN

IS JUST FOR RAIN!
